Muhammad Riaz Khan

Deputy Director
Geophysical Centre, Quetta

Mr. Wash Dev Khatri

Assistant Meteorologist
Seismic Monitoring Center
G.C, Quetta

Mr. Arifullah

The Seismological Bulletin of Pakistan is a monthly publication containing data of
Seismological Network of Pakistan

PREFACE

Pakistan Meteorological Department (PMD) has been recording the intensity and magnitude of earthquakes since 1951, at seismic Observatory Quetta. In the beginning, the instruments namely Sprinter were being used. Later on, the Sprenter instruments were replaced by WWSSN as part of global seismic network till 2006. After 2006, the digital seismic monitoring equipments known as GURALP system were installed across Pakistan including Quetta, Islamabad, Peshawar, Lahore, Zhob, Turbat, Gilgit. Since then, the GURALP Instruments are regularly being used to record the earthquake events across the country and the neighboring countries.

Earthquake activity in Pakistan is mainly concentrated in the north and western sections of the country, along the conjunctions of Indian plate with the Iranian and Afghan micro-plates. The Chaman Fault runs along Pakistan's western frontier with Afghanistan from Kalat, in the northern Makran range, past Quetta and then on to Kabul, Afghanistan. A fault also runs along the Makran coast and is believed to be of the same nature as the West Coast fault along the coast of Maharashtra, An active subduction zone exists off the Makran coast.

This zone forms the boundary between the Arabian and the Iranian micro-plate, where the former subducts or dives beneath the latter. Thrust zones run along the Kirthar, Sulaiman and Salt ranges. There are four faults in and around Karachi and other parts of deltaic Indus, and Makran coast. The first is the Allah Bund fault that passes through Shahbunder, Jah, Pakistan Steel Mills, and runs through eastern parts of the city and ends near Cape Monz record depicts that fault, in fact, has caused extensive damage in the past many centuries in the deltaic areas. The destruction of Bhanbhor in the 13th century and damage to Shahbunder in 1896 were caused by this fault. The other one emanates from the Rann of Kutchh. The third one is the Pubb fault which ends into Arabian sea near Makran coast and the last one is located in the lower Dadu district near Surajani and falls in the vicinity of Karachi. Tsunamis or tidal waves have also affected the coast of Pakistan. The worst case was in 1945 when an earthquake of magnitude 8 struck the Makran coast, generating Tsunami washing away the town of Gwadar, waves as high as 12 meters.

The 1935 Quetta earthquake occurred on 31 May between 2:33 am and 3:40 am at Quetta, Balochistan. The earthquake had a magnitude of 7.7 and more than 30,000, people died from the impact. This ranked as the deadliest earthquake that hit South Asia until the October 08, 2005 Kashmir earthquake that devastated most parts of Kashmir and adjoining areas with death toll of more than 70,000 and millions homeless.

Abbreviations:

H	=	Origin Time.
ep, es & ex	=	emergence of primary-wave and emergence of shear wave and Unidentified wave
Mb	=	Body wave magnitude on Richter scale.
Mw	=	USGS magnitude on Richter scale.
H, M, S	=	Hours, Minute and Second in GMT.
Ipc	=	impulsive phase compression.
Ipd	=	impulsive phase dilatation.
N.S.M.C	=	National Seismic Monitoring Centre.
R.S.M.C	=	Regional Seismic Monitoring Centre.
D.S.E	=	Digital Seismic Equipment.

SUMMARY

The Seismic Monitoring Network of Pakistan Meteorological Department is working round the clock to record and monitor seismic activities all over the world, especially Pakistan, the South-Asia and neighboring countries.

In the month of June 2019, total numbers of events recorded by PMD Seismic network were 68. The frequency analysis based on magnitude of events depicts that 01 events were Minor (03-3.9), 30 events were of mild magnitude (04-4.9). The network also recorded 20 events of moderate magnitude (05-5.9) and 06 events of severe magnitude (06-6.9). 01 events of violent were reported by PMD Seismic network in the month of June, 2019 as depicted in the Figure 1.

Figure 1: Frequency Analysis of the Magnitude of the Seismic Events Recorded by PMD Seismic Network

Figure01: shows the number of events recorded during the month of June, 2019 for different categories of severity.

FOCAL DEPTH

The frequency analysis based on focal depth of Seismic events for the month of June, 2019 was carried out. In the month of July, 2019 PMD Seismic network recorded totally 27 numbers of Major Seismic events.

The analysis depicts that the frequency of Shallow focal depth (0-70 km) seismic events was maximum with 20 numbers. Shallow focal depth earthquakes are also known as crustal earthquakes.

The Intermediate focal depth (70-300 km) seismic events were 04 numbers and 03 number of deep focal depth (>700 km) seismic events recorded by PMD Seismic network. Deep focal depth earthquakes also known as Intra-Plate earthquakes.

Figure2: Frequency analysis of major earthquakes based on focal depth during the month of June, 2019.
